

MULTI-FUNCTION WIRING DEVICE

Abstract

- 5 The present invention is a multi-function wiring device includes a first interface, a plurality of second interfaces, a first switch and a second switch. The first interface is used for the insertion of a handheld device. The second interfaces are to connect a computer or any peripheral via a corresponding transmission wire. The first switch couples to the first interface and the second
- 10 interfaces for users to manually select anyone of the second interfaces. The second switch couples to the first interface, the second interfaces and the first switch. When the second switch is pressed, an electrical connection is set up between the first interface and the second interfaces selected via the first switch. Moreover, the present invention has a charging circuitry for charging the
- 15 handheld device.
